

This file shows how to embed any files into output PDF file

Check Attachments panel of Adobe Acrobat/Reader to see the source XSL-FO file attached.

PDF format allows embedding any files into the PDF file. These files can be opened via menu item Document->File Attachments inside Adobe Acrobat 6.0+ or Adobe Reader. To embed any file into the generated PDF document produced by Altsoft Xml2PDF, use the `<altsoft:attachment>` tag inside XSL-FO declarations section.

DTD:

```
<!ELEMENT attachement EMPTY>
<!ATTLIST attachement
  src CDATA #REQUIRED
  name CDATA #IMPLIED
  description CDATA #IMPLIED>
```

`src` - URI of the file to be attached;
`name` - attachment name to be used by Adobe Acrobat. By default this is just the local file name;
`description` - description of the file to be shown by Adobe Acrobat next to the attachment.

This tag must be the first level descendant of `<fo:declarations>` element. For example, to attach the source XSL-FO file to the output PDF document use the following declaration:

```
<fo:declarations xmlns:altsoft="http://alt-soft.com/xml2pdf/extensions">
  ...
  <altsoft:attachement
    src="hello_world.fo"
    description="Source XSL-FO file" />
  ...
</fo:declarations>
```
